2 BACKGROUND

In this section, we delve into the foundational aspects of our investigation, focusing on the fundamental components of NLP-based PDF readers. We outline key concepts and terminology essential for understanding the intricacies of this technology, setting the stage for a comprehensive exploration of its various dimensions.

2.1 Document Structure and Representation

PDF documents, as a ubiquitous format for storing and sharing information, present a structured framework comprising textual content, images, graphs, and other multimedia elements. Understanding the hierarchical structure of PDF documents is essential for effective data extraction and interpretation. Researchers have explored various approaches for parsing PDF files, including syntactic analysis and semantic labeling techniques [1]. Additionally, advancements in optical character recognition (OCR) technology have enabled the extraction of text from scanned documents, further enriching the data space with digitized textual content [2].

2.2 Semantic Understanding and Context Extraction

Semantic understanding involves the comprehension of the meaning and context embedded within textual data. Within the data space of PDF documents, semantic understanding plays a pivotal role in tasks such as retrieving information, summarizing, and answering questions. Natural Language Processing (NLP) techniques, including named entity recognition, sentiment analysis, and topic modeling, facilitate the extraction of semantic information from PDF content [5]. Moreover, deep learning models, such as transformers and recurrent neural networks, have demonstrated remarkable performance in capturing semantic nuances and contextual dependencies within text.

6 METHODOLOGY

We conducted this scoping review, a method utilized to rapidly analyze existing literature by mapping information using defined key concepts to find evidence and identify research gaps. Following the guidance article by Peters et al. and adhering to the PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews) checklist introduced by Tricco et al. our methodology was structured to ensure comprehensiveness and transparency in our review process. Our main objective was to provide a comprehensive overview of the NLP-based PDF reader technology landscape by addressing three key research questions. Firstly, we sought to identify the state-of-the-art approaches and methodologies employed in the development of NLP-based PDF readers. Secondly, we aimed to assess the effectiveness and usability of existing NLP-based PDF reader applications in real-world scenarios. Finally, we aimed to identify gaps and opportunities for future research and innovation in the field of NLP-based PDF readers. To achieve these objectives, we defined clear inclusion and exclusion criteria to guide the selection of relevant literature. We included studies that focused on NLP-based PDF reader technology, encompassing both academic research papers and industry reports. We excluded studies that did not directly address NLP-based PDF reader technology or were not available in English due to limitations in translation resources and accessibility. Our searching strategy was designed to be comprehensive and non-selective, involving searches across multiple databases, including scholarly repositories, academic journals, and conference proceedings. Additionally, we conducted searches for unpublished studies and engaged in personal communication with researchers to obtain complete information about relevant studies, thereby minimizing the risk of publication bias. Regarding language bias, while PRISMA recommends that systematic reviews should not be limited to studies published in a specific language, a limitation of our study is the selection of English-only papers. This decision was made due to constraints in translation resources and the lack of a comprehensive non-English literature. For future updates of this review, we propose to revise the search strategy, reassess inclusion and exclusion criteria, conduct a new quality assessment, and update the data analysis to ensure the review remains current and

relevant. Additionally, we declare that we have no conflicts of interest that could potentially bias the objectivity or impartiality of our review, thereby ensuring the integrity of our findings.
